- **Neutron Star Collisions:** Merging neutron stars can produce black holes.
- **Primordial Black Holes:** Hypothetical black holes formed shortly after the Big Bang due to density fluctuations.

Types of Black Holes

Black holes are generally classified into three categories:

- **Stellar-Mass Black Holes:** Ranging from about 5 to 20 times the mass of our Sun.
- **Supermassive Black Holes:** Millions to billions of solar masses, residing in galaxy centers.
- **Intermediate Black Holes:** Hypothetical black holes with masses between stellar and supermassive black holes.

Introducing Black Hole 7: The Cosmic Enigma

Black Hole 7 is a designation used by astronomers to identify a specific black hole of interest, often due to its unique features or its role in recent research. Though not as widely recognized as some of the well-studied supermassive black holes, Black Hole 7 has become a focal point in understanding black hole diversity and behavior.

Why Is Black Hole 7 Significant?

- **Unique Mass Range:** Its mass places it in an intermediate category, bridging stellar and supermassive black holes.
- **Unusual Accretion Activity:** Exhibits atypical accretion disk behaviors, offering clues about black hole feeding processes.
- **Location and Environment:** Situated in a relatively isolated galaxy, providing a pristine laboratory for study.
