Definition and Basic Properties

A matrix $A = [a_{ij}]$ of size $(m \times n)$ is called nonnegative if every element satisfies $a_{ij} \geq 0$ for all (i, j) . Such matrices are denoted as $A \geq 0$. The set of all nonnegative matrices forms a convex cone in the space of real matrices.

- Eigenvalue multiplicity: The Perron eigenvalue is simple (has algebraic multiplicity one) for irreducible matrices, which influences stability and convergence in iterative algorithms.

Types of Nonnegative Matrices

- Irreducible matrices: Cannot be brought into block upper-triangular form via simultaneous row and column permutations, indicating a strong form of connectivity.
- Reducible matrices: Can be decomposed into block upper-triangular form, representing systems with disconnected or weakly connected components.
