Fundamentals of Irrigation Engineering

- Types of Irrigation

Understanding different irrigation methods helps in selecting the appropriate system based on topography, soil type, crop requirements, and water availability.

- Surface Irrigation: Water flows over the soil surface by gravity. Examples include basin, border, and furrow irrigation.
- Drip Irrigation: Water drips slowly to the roots through pipes or tubes, minimizing wastage.
- Sprinkler Irrigation: Water is sprayed over the crops using a system of pipes and sprinklers, simulating rainfall.
- Subsurface Irrigation: Water is applied below the surface, directly to the root zone.

- Components of an Irrigation System

- Reservoirs and Storage Tanks: Store water for later use.
- Canals and Channels: Convey water from source to fields.
- Distribution Systems: Control water flow and distribution.
- Field Channels: Deliver water to individual fields.

- Hydraulic Design of Canals

The design involves calculations for flow velocity, cross-sectional area, and slope to ensure efficient conveyance without excessive erosion or sedimentation.

Key considerations:

- Discharge (Q): Volume of water flowing per second.
- Velocity (V): Speed of water flow.

- Cross-Sectional Area (A): Cross-sectional size of the canal.
- Gradient or Slope: Determines flow velocity.

Water Power: Harnessing Hydroelectric Energy

- Principles of Water Power Generation

Water power systems convert the potential and kinetic energy of flowing water into electrical energy through turbines and generators.

- Potential Energy: Due to elevation difference (head).
- Kinetic Energy: Due to velocity of water flow.

Main components:

- Reaction Turbines: Use both the velocity and pressure of water (e.g., Francis, Kaplan turbines).

Key Calculations in Irrigation and Water Power (Punmia Approach)

- Discharge and Flow Calculations

- Discharge (Q): Usually calculated using Manning's formula for open channels:

$$Q = \frac{1}{n} A R^{2/3} S^{1/2}$$

where:

- n = Manning's roughness coefficient
- A = cross-sectional area
- R = hydraulic radius (A / wetted perimeter)
- S = slope of the channel

- Flow velocity (V): $V = Q / A$

- Head and Power in Water Power Systems

- Total Head (H): Sum of elevation head and velocity head.

$$H = z + v^2 / 2g$$

where:

- z = elevation head
- v = velocity of water
- g = acceleration due to gravity

- Power (P): Power generated can be calculated as:

$$P = \rho g H Q \eta$$

where:

- ρ = density of water (approx. 1000 kg/m³)
- η = efficiency of turbine-generator system

- Efficiency Considerations

- Hydraulic efficiency depends on turbine design.
- Overall efficiency considers generator and transmission losses.
