- Iron ore is heated in a blast furnace to produce pig iron.
- Copper concentrates are roasted and smelted to produce blister copper.

Refining further purifies the metal:

- Electrorefining for copper.
- Zone refining for high-purity metals.

3. Alloying and Fabrication

Once purified, metals can be combined with other elements to form alloys that possess specific properties. Examples include:

- Steel (iron + carbon).
- Brass (copper + zinc).
- Aluminum alloys for lightweight applications.

Fabrication involves shaping metals into usable forms:

- Casting (pouring molten metal into molds).
- Machining (cutting, drilling).
- Welding and joining.

4. Heat Treatment and Mechanical Processing

These processes alter the internal structure to achieve desired properties:

- Annealing: heating and slow cooling to soften metals.

- Quenching: rapid cooling to increase hardness.
- Tempering: reheating to improve toughness.

Mechanical processing like rolling or forging refines shape and mechanical characteristics.
