Sample Questions and Detailed Answers from 24th May 2012

Biology Section

Question 1: Describe the process of photosynthesis.

Sample Answer:

Photosynthesis is the process by which green plants use sunlight to produce glucose and oxygen from carbon dioxide and water. It occurs mainly in the chloroplasts within leaf cells, where chlorophyll absorbs light energy. The process involves two main stages: the light-dependent reactions, where light energy splits water molecules to release oxygen and produce energy carriers (ATP and NADPH), and the light-independent reactions (Calvin cycle), where these energy carriers convert carbon dioxide into glucose.

Key points for full marks:

- Sunlight absorption by chlorophyll
- Role of chloroplasts
- Conversion of carbon dioxide and water
- Production of glucose and oxygen

Question 2: Explain how antibiotics kill bacteria but not human cells.

Sample Answer:

Antibiotics target specific features of bacterial cells that are absent in human cells. For example, many antibiotics inhibit bacterial cell wall synthesis, which is essential for bacterial survival but not present in human cells. By disrupting these bacterial features, antibiotics kill or inhibit bacteria.

without harming human cells.

Key points:

- Specific bacterial features targeted (cell wall, enzymes)
- Human cells lack these features
- Selective toxicity

Chemistry Section

Question 1: Write a balanced symbol equation for the reaction between magnesium and hydrochloric acid.

Sample Answer:

Explanation:

- Magnesium (Mg) reacts with hydrochloric acid (HCl).
- Produces magnesium chloride (MgCl₂) and hydrogen gas (H₂).
- The equation is balanced with one Mg atom, two Cl atoms, and two H atoms on each side.

Question 2: Describe how the reactivity of the halogens changes down Group 17.

Sample Answer:

The reactivity of halogens decreases as you go down Group 17. This is because the atomic size increases, so the outer electrons are farther from the nucleus and less strongly attracted. Consequently, it becomes harder for larger halogen atoms to gain an electron, reducing their reactivity.

Key points:

- Atomic size increases down the group
- Electron affinity decreases
- Less reactive as you go down

Physics Section

Question 1: Explain why a car accelerates when the driver presses the accelerator pedal.

Sample Answer:

Pressing the accelerator increases the fuel supply to the engine, producing more power. This extra power is transferred to the wheels, increasing the force acting on the car. According to Newton's second law ($\text{Force} = \text{mass} \times \text{acceleration}$), as the force increases and the mass remains constant, the acceleration of the car increases.

Key points:

- Increased fuel leads to more engine power
- More force applied to the wheels
- Newton's second law explains acceleration

Question 2: Describe how a transformer steps down voltage for household use.

Sample Answer:

A transformer consists of two coils of wire (primary and secondary) wound around a magnetic core. When an alternating current flows through the primary coil, it creates a changing magnetic field, inducing a voltage in the secondary coil. In a step-down transformer, the secondary coil has fewer turns than the primary, which reduces the voltage to a safer level suitable for household appliances.

Key points:

- Alternating current creates changing magnetic field
- Fewer turns on secondary coil = lower voltage
- Used to make voltage safe for home use
